Enterprise Partner Lifecycle Studio

Partner Capability. Growth. Execution.
Assess. Decide. Execute.

Assess partner readiness across seven lifecycle scenarios, recommend the right motion, and generate an executive action plan with maturity scoring, governance, KPIs, business case, risks, and execution roadmap.

- Illustrative Data
- No API Key
- Browser-native

Partner Capability. Growth. Execution.

Assess. Decide. Execute.

Evaluate partner readiness, make an evidence-based decision, and generate a scenario-specific plan for investment, enablement, governance, and execution.

- Select a scenario
- Run quick demo
- Open the home page

How the Assessment Works

- 1

Choose a Partner Lifecycle Scenario
Select one of seven scenarios: onboard, build, launch, scale, recover, compete, or offboard.
- 2

Complete the Executive Assessment
Answer scenario-specific questions covering strategy, readiness, operations, governance, and investment.
- 3

Review Executive Deliverables
Receive recommendations, maturity scoring, investment priorities, roadmap, governance, KPIs, business case, risks, and execution plan.

Choose a Partner Lifecycle Scenario

Each scenario has its own assessment questions, scoring model, recommendation, and operating plan.

THE PROBLEM

Partner lifecycle decisions are often subjective, fragmented, and hard to govern.

Partner teams need to decide where to invest, enable, recover, scale, compete, or exit without relying on anecdotal judgment.

Partner investment is hard to compare

Different teams evaluate readiness using different criteria, so funding and enablement decisions become inconsistent.

Enablement often measures activity

Training sessions, badges, and calls are tracked, but partner independence and execution evidence are harder to prove.

Governance arrives too late

Risks, approval gates, customer impact, and exit conditions are often documented after the decision is already in motion.

Business cases are disconnected

Partner pipeline, services margin, investment, and payback are rarely tied to the readiness evidence driving the motion.

Core issue: the partner decision is usually made before the evidence, scoring, governance, and execution plan are fully aligned.

WHAT IT DOES

A partner lifecycle decision studio, not a static checklist.

The tool converts scenario-specific assessment inputs into a recommendation, operating plan, and executive deliverables.

SEVEN LIFECYCLE SCENARIOS

One assessment pattern, seven partner motions.

Each scenario has its own questions, scoring model, recommendation thresholds, and operating plan.

01 Onboard

New partner: Prospective or newly signed partner investment and activation.

02 Build

Partner practice: Create a new AI, cloud, security, networking, or data practice.

03 Launch

Partner service: Evaluate readiness for a recurring managed service motion.

04 Scale

Partner scale: Expand a successful practice across regions, sellers, and delivery teams.

05 Recover

Partner recovery: Diagnose underperformance and decide whether recovery is viable.

06 Compete

Competition: Build a displacement plan to help a partner win against an incumbent.

07 Offboard

Lifecycle exit: Govern a partner exit while protecting customers, contracts, and revenue.

Why it matters: one tool supports the full partner lifecycle instead of building separate spreadsheets, decks, and scorecards for every motion.

EXECUTIVE DELIVERABLES

Nine outputs from one partner assessment.

The output package is built for leadership review, partner management, and execution follow-through.

Executive Recommendation

Recommended motion with rationale and conditions.

Maturity & Readiness

Current level, target level, independence score.

Investment Priorities

Where to fund enablement, GTM, support, and delivery readiness.

Enablement Plan

Workstreams, owners, exit evidence, and partner champions.

Business Case

ARR potential, pipeline, payback, services margin, and gates.

Execution Roadmap

30/60/90-day sequence with decision checkpoints.

Governance Model

Approvals, QBR cadence, escalation path, and stakeholder roles.

Partner Risk Register

Risks, mitigation actions, owners, and acceptance criteria.

Objection Coaching

Response patterns for resistance and decision friction.

SCENARIO-SPECIFIC SCORING

The scoring weights change by partner motion.

A recovery decision is not scored like an onboarding decision. Managed services are not scored like offboarding.

Strategic fit Market access, alignment, and differentiated value.	Technical readiness Architecture, certifications, solution capability.	Commercial potential Pipeline, revenue, margin, and financial commitment.	Delivery readiness Support model, services capacity, customer continuity.
Leadership commitment Executive sponsorship, partner ownership, escalation path.	Operational maturity Cadence, governance, reporting, QBR, and KPIs.	Efficiency Ability to scale without creating dependency.	Risk confidence Likelihood of successful execution without material harm.
Example difference Recovery emphasizes leadership willingness and support-model confidence.		Example difference Managed services emphasize operating model and service economics.	

ASSESSMENT WORKFLOW

A structured executive assessment from context to decision.

The wizard captures business context, scores readiness, and generates a complete execution package.

BUSINESS CASE MODEL

Connect partner enablement to economics.

The tool turns readiness inputs into an illustrative commercial view that supports investment decisions.

ARR

\$ Monthly potential × 12

Pipeline

Qualified opportunities

Margin

Target services margin

Payback

Investment / monthly value

Gate

Scale or stop

Decision gates

Capability: champions pass readiness review.
Market: qualified opportunity or lighthouse motion.
Execution: partner-led engagement proves capability.
Scale: evidence supports broader investment.

Why this matters

Prevents enablement from becoming activity without measurable partner outcomes.
Links funding to readiness evidence, pipeline, and independent execution.

ROADMAP & KPIS

Measure partner capability, not just activity.

The execution model uses leading indicators and outcome measures to decide whether to scale, extend, recover, or exit.

Capability attainment

Champions ready

Engagement frequency

Structured partner motion

Partner-sourced pipeline

Commercial outcome

Partner independence

Quality and sustainability

ARCHITECTURE · HLD

Browser-native decision studio with a scenario engine and export layer.

Single-page application, no server required, suitable for GitHub Pages and portfolio reviews.

Presentation

Hero, scenario selection, assessment wizard, result tabs, export actions.
Dark executive UI with responsive layout.

Scenario Engine

Seven lifecycle scenarios with unique questions, labels, scoring weights, recommendation thresholds, and output logic.

Scoring & Outputs

Maturity model, partner independence, business case, governance, roadmap, KPIs, risks, and objection coaching.

Deployment pattern: static HTML + CSS + JavaScript. No backend. No API key required for illustrative mode.

ARCHITECTURE · LLD

Scenario objects drive questions, weights, recommendations, and output tabs.

Adding a new lifecycle scenario means defining its context, scoring dimensions, recommendation logic, and output labels.

```
const scenarios = [
  { id: 'onboard', action: 'Onboard',
    outcome: 'Partner investment decision + 90-day plan' },
  { id: 'recover', action: 'Recover',
    outcome: 'Recovery, maintenance, or exit recommendation' },
  { id: 'offboard', action: 'Offboard',
    outcome: 'Exit recommendation + transition plan' }
];

recommendation(score) {
  return score >= 82 ? 'Proceed' :
    score >= 66 ? 'Proceed with conditions' :
    score >= 50 ? 'Delay and stabilize' : 'Recover or exit';
}
```

Configuration model

Scenario metadata defines the lifecycle motion and executive output language.

Scoring model

Dimension weights change by scenario, so each decision uses the right evidence.

Output model

The same assessment produces recommendation, roadmap, business case, governance, and risks.

KEY BENEFITS

What this demonstrates and what it replaces.

A structured way to make partner ecosystem decisions with evidence, transparency, and execution discipline.

LIVE PROJECT · NO API KEY REQUIRED

Try the Enterprise Partner Lifecycle Studio.

Select a lifecycle scenario. Complete the assessment. Review the recommendation, maturity model, roadmap, KPIs, governance, business case, risks, and execution plan.

Talk track

Choose one of seven partner lifecycle scenarios.
Run the scenario-specific executive assessment.
Generate a decision package with maturity, governance, KPI, business case, risk, and execution outputs.
Use it to discuss partner enablement, GTM strategy, advisory services, or program leadership.

Best interview opening

“This project shows how I translate partner strategy into decision logic, executive outputs, governance, and execution plans.”
